

Certificate

The ecological optimisation und the prudent and responsible use of resources are elemental parts of our transport logistics.

The ever growing need for transport and the related logistical- and environmental risks mean it is important to join up the advantages of transport of goods by lorry and rail.

The combined transport links up the traffic carriers road and railway so that each of their positive aspects can be used as optimally as possible. Through the switching of transport from the road to the rail, motorways and main roads could be relieved of their traffic and the environment could be better protected from negative influences. The man-made emissions of greenhouse gasses which cause a further warming of the atmosphere should be reduced throughout the world. Through this, the threat of climate change could be reduced or slowed down in its progression. The "most prominent" type of greenhouse gasses with the highest amount of emissions is carbon dioxide (CO₂).

_____ has in the year _____

transferred over _____ tonnes from the road onto rail

which resulted in a saving of _____ tonnes of carbon dioxide.

In the name of environmental- and climate protection, we thank you for your work!

Norbert Wenzel, CEO

Mag. Markus Himmelbauer, CFO

**We are reducing CO₂! We travel by rail!
We don't just talk about transferring traffic from the road to the rail, we do it!**
